ö
transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the anti-HCV enzymatic nucleic acid sequences disclosed in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analytss of gene expression ($AGE) so as to identify skin-expressed genes and quantify their expression (M1) is useful for identifying genes involved in skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis and to test agent (A) that maintains or ichthyosis; apositically neurodermatitis; sunburn; psoriasis; scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (EST) of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, skin, dermatological, vulnerary, antipsoriatic, antiseborrhaeic, immunosuppressive, antiinflammatory; cytostatic, SAGB; neurodermatitis; psoriasis, dermatitis, skin cancer, EST; expressed sequence tag; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to in vitro identification (MI) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression.

(MI) is useful for identifying genes involved in skin homeostasis; to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (EST) of the invention

The invention relates to an apparatus for carrying out sample preparation
and multiplex detection of panels of target nucleic acids and antigens in
a sample, comprising a sample preparation zone, several three dimensional
capture probe platforms for capturing specific classes of target
molecules and spacer elements for separating the sets of three
capture probe platforms. The apparatus is useful for carrying
out multiplex detection of panels of target nucleic acids and antigens of unterest, treating the sample with a sample buffer to form a
pre-processed sample, passing the pre-processes sample buffer to form a
probes of the apparatus, reacting a label with a signal probe, the signal
probe having specificity for at least one other signal probe that is
specific for the target and detecting the reacted level. Sequences
ACAG1741-ACASISO and ACD17023-ACD17041 represent DNA molecules used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Multiplex detection; ss; spacer element; three dimensional capture probe.
Multiplex detection; ss; spacer element; three dimensional capture probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            panels of

The invention relates to an apparatus for carrying out sample preparation and multiplex detection of panels of target nucleic acids and antigens in a sample, comparising a sample preparation zone, several three dimensional capture probe platforms for capturing specific classes of target molecules and spacer elements for separating the sets of three dimensional capture probe platforms. The apparatus is useful for carrying cut multiplex detection of panels of target mucleic acids and antigens of antigens of interest, treating the sample with a sample buffer to form a processed sample passing the pre-processes sample buffer to form a proparatus, capturing the target nucleic acids and antigens of the apparatus, reacting a label with a signal probe that is probe having specificity for at least one other signal probe that is specific for the target and detecting the reacted level. AAT49608-T49863 represent target sequences for the human cholesterol cester transfer procein (CETP) hammerhead (HH) ribozymes (see AAT498B1-CETP is a 74 kD glycoprotein Lat facilitates neutral lipid transfer between plasma lipoproteins. The numbering of the targets refers to the position of the cleavage site in full length CETP. The ribozyme cc to the position of the cleavage site in full length CETP. The ribozyme is immediately upstream. The ribozymes are able to cleave mRNA from the cgene encoding CETP, thereby blocking synthesis and/or expression of the mRNA. By inhibiting CETP, the reverse cholesterol transport (RCT) pathway cc can be inhibited (or eliminated) thereby preventing the reduction in size cenditions associated with ahormal levels of CETP, specifically familial complications associated with ahormal levels of CETP, specifically familial hypercholesterolaemia, atherosclerosis, peripheral vascular disease, hyperbetalipoproteinaemia, atherosclerosis, peripheral vascular disease, to angloplastic restenosis. By inhibiting CETP, the levels of HDL and low density lipoproteins (IDL), and the HDL:LDL ratio are favourably altered (a decrease in LDL levels, and a corresponding increase in HDL levels).

CT density lipoproteins (IDL), and the HDL:LDL ratio are favourably altered angloplastic restenosis. By inhibiting CETP, the levels of HDL evels).

CT he HH ribozymes can also be used diagnostically to study genetic drift and mutations in diseased cells, and to detect CETP mRNA. As the HH ribozymes trains of the CETP gene, they have low non-specific activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Probe, 23S rRNA, 16SrRNA, tuberculosis; MTC; MOTT; peptide nucleic acid; mycobacterium tuberculosis complex; precursor rRNA; rDNA; 5S rRNA; 8S; mycobacterium other than tuberculosis; mutant; 16S-mediated streptomycin resistance.
                                                                                                                                                                                                                 New ribozyme(s) for cleaving cholesterol ester transfer protein mRNA useful for preventing or treating initial development, progression or regression of vascular diseases, esp. familial hypercholesterolaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

```
The invention relates to a peptide nucleic acid capable of hybridising to a target sequence of Mycobacterial rDNA, precursor rRNA or rRNA (5s, 16s or 1235) forming detectable hybrids. Also included are detecting a target sequence of mycobacteria in a sample comprising contacting rRNA or rDNA in the sample with peptide nucleic acid probes (hybridisation takes place between the probe and the rRNA or rDNA, observing or measuring any formed detectable hybrids and ranks, observing or measurement to the presence of a target sequence of mycobacteria in the sample, and a target sequence of mycobacteria in particular a target sequence of mycobacterial in particular and target sequence of mycobacterial in particular and target sequence of mycobacterial and target sequence of mycobacterial and water present in a sample, e.g. sputum, laryngeal swabs, gastric lavage, bronchial washings, biopsies, aspirates, expectorates, body fluids, urine, tissue sections as well as food samples, soil, air and water or mycobacteria. It is able to hybridise to Mycobacterial precursor the mycobacteria. It is able to hybridise to Mycobacterial precursor therefore avoiding a risk of interfering with the morphology of the cells. TRNA around position 473-477, associated with 165-mediated streptomycin residence.
                                                                                                                                                                                                                                                                                                               Peptide nucleic acid probes for detecting target sequences of Mycobacteria in samples, e.g., sputum, which are capable of hybridizing to a traget sequence of mycobacterial rDNA, precursor rRNA or rRNA forming detectable hybrids.
                                                                                                                                                                                                                  Stender H, Lund K, Mollerup TA;
                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 22; Page 40; 74pp; English.

Homo sapiens

AAT49608-T49863 represent target sequences for the human cholesterol
ester transfer protein (CETP) hammerhead (HH) ribozymes (see AAT49881CET 510137). CETP is a 74 kD glycoprotein that facilitates neutral lipids
transfer between plasma lipoproteins. The numbering of the targets refers
transfer between plasma lipoproteins. The numbering of the targets refers
to the position of the cleavage site in full length CETP. The ribozyme
condition of the cleavage site in full length CETP. The ribozyme
is immediately upstream. The ribozymes are able to cleave mRNA from the
can be inhibited CETP, thereby blocking synthesis and/or expression of the
mRNA. By inhibiting CETP, the reverse cholesterol transport (RCT) pathway
can be inhibited (or eliminated) thereby preventing the reduction in size
density of the high density lipoproteins (HDL), prolonging HDL half life,
and therefore increasing HDL levels. The ribozymes can be used to treat
conditions associated with abnormal levels of cETP, specifically familial
conditions associated with abnormal levels of GETP, specifically familial
conditions associated with abnormal levels of HDL and low
ascular complications of diabotes, transplant, atherectony and
cangioplastic restences; by inhibiting CETP, the levels of HDL and low
density lipoproteins (LDL), and the HDL:LDL ratio are favourably altered
(a decrease in LDL levels, and a corresponding increase in HDL levels).
The HH ribozymes can also be used diagnostically to study genetic drift
cand mutations in diseased cells, and to detect CETP gene, they have low non-New ribozyme(s) for cleaving cholesterol ester transfer protein mRNA useful for preventing or treating initial development, progression or regression of vascular diseases, esp. familial hypercholesterolaemia. . 0 49.0%; Score 9.8; DB 1; Length 15; 84.6%; Pred.                                                                                                                                                                                     AAT70094-96 are primers used to construct a vector capable of expressing human neurotrophin 3 (NT-3). Active NT-3 is produced by the method of the invention, which comprises transforming a prokaryotic host cell with an NT-3 gene to express the NT-3, and then NT-3 produced is refolded correctly in a redox buffer. The active NT-3 produced by the method can be used as a reagent for research on the differentiation of cells,
                                                                                                                             Preparation of active correctly folded neurotrophin-3 - which can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAT80036-T80041 represent amplification primers for the alpha2 integrin coding sequence. the amplification of the alphal integrin coding sequence. These sequences can be used in the method of the invention. The method of the invention is for the identification of a mammal having, or at risk of developing, glomerulopathy. The method comprises analysing a tissue sample from a mammal known to contain cells expressing integrin RNA or protein for integrin subunit expression. The integrin subunit expression in the sample is then compared with a control tissue sample, where altered can be modified to identify a mammal with diabetes who has, or is at risk of developing, secondary pathological changes associated with diabetes. An increase in alpha2,3,5 or beta-1 integrin expression and/or a decrease in alpha1 expression is diagnostic of increased risk of nephropathy. The methods can be used to determine if patients are likely to develop severe nephropathy and to monitor progress of disease during treatment protocols
                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor;

                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to haplotyping the FK506-binding protein 8 (38kD) (FKBB8) gene in an individual. The method involves determining the identity of the nucleotide pair at one or more polymorphic sites selected from P1 to P26 (described in the specification). The invention is useful to improve the efficiency and reliability of several steps in the discovery and development of drugs for treating diseases associated with FKBP8 activity, for example immunosuppression and cancer. Sequences AAI6724-299 represent allale-specific oligonucleotide (ASO) probes for detecting FKBP8 gene polymorphisms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New haplotypes of the FKS06-binding protein 8 gene, useful for genotyping that gene in individual and to design new therapy for associated disease such as immunosuppression and cancer.
vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense Oligonucleotide, (for Insuln-like Growth Factor [IGF] receptor, IGF binding protein [IGFBP] 2 or IGFBP3), which is capable inhibiting or reducing growth factor mediated cell proliferation, inhibiting or reducing growth factor mediated cell proliferation, inhibiting or reducing growth factor mediated cell proliferation, oligonucleotide which can be used to design the antisense oligonucleotide of the present invention (see AAF4151 and AAF45153-P45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, build in seful for ameliorating the effects of psoriasis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                                                    antiproliferative; antiinflammatory; antipsoriatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 screeptor, IGF binding protein [IGFBP]-2 or IGFBP], which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, incoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovosscular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     present invention relates to a method for ameliorating the effects of
                                                                                                antiproliferative; antiinflammatory; antipsoriatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  49.0%; Score 9.8; DB 1; Length 15; 84.6%; Pred. The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisone oligonicleotide, (for Insulin-like Growth Pactor [IGF]-1 receptor, IGF binding protein [IGFB]-2 or IGFBB], which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonicleotide which can be used to design the antisense oligonicleotide which can be used to design the antisense oligonicleotides of the present invention (see AAF41515 and AAF45153 or A5161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pliaris, serborrhoea, keloids, keratosis, chthyosis, scleroderma, warts, benign growths, cancers of the skin, a hopparance of the sin, and paran or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ameliorating the effects of a disorder, e.g. psoriasis, by administering V (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antisense therapy, antiproliferative, antiinflammatory, antipsoriatic, cytostatic, dermatological, cardiant, virucide, ophthalmological, keloid, skin disorder, Insulin-like Growth Factor 1 receptor, IGF-1, pityriasis,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a method for ameliorating the effects of akin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBB]-2 or IGFBB), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF4151 and AAF45151-745161). The method is useful for ameliorating the effects of psoriasis, nebhods is pityriasis, ruba, plaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition growth factor-mediated malignancies, other sclerotic disease, hidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                    Wraight CJ, Werther GA, Edmondson SR,

Antisense therapy; antiproliferative; antiinflammatory; antipsoriatic; cytostatic; dermatological; cardiant; virucide; ophthalmological; keloid; skin disorder; Insulin-like Growth Factor I receptor; IGF-1; pityriasis; IGF binding protein; IGFBP-2; IGFBP3; inflammation; psoriasis; pilaris; growth factor mediated cell Proliferation; ichthyosis; serborrhoea; ruba; keratosis; neoplasia; scleroderma; wart; skin cancer; sclerotic disease; hyperneovascular condition; hyperplasia; kidney disease;

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an anticompleted decide, (for Insulin-like Growth Pactor [GGP]-1 receptor, IGF binding protein [IGFB]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the artisense oligonucleotide which can invention (see AAF45151 and AAF45153-F4516). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition of the retina, the print factor mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood vessels or any other hyperplasia Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or Gaps 49.0%; Score 9.8; DB 1; Length 15; 84.6%; Pred.                               The present invention relates to a method for producing recombinant proteins. The method comprises preparing a recombinant vector for transforming a host cell before culturing the obtained transformant, assaying expression of the reporter gene and confirming high expression of the recombinant proteins are useful as drugs, raw materials for industries and feeding stuffs. Also, the proteins are obtainable on large-scale production. The present sequence was used to illustrate the invention
                                                                                                                                                                                                                                                                                                                          Gaps

The invention comprises the amino acid and coding sequence of the human N-acetylgalactosaminidase (NAGA) alpha protein. The invention specifically comprises novel polymorphic aites identified within the NAGA gene. The NAGA gene is located on chromosome 22q13.2-q13.31, and encodes a lysosomal glycohydrolase that cleaves alpha-N-acetylgalactosaminyl moieties in glycoconjugates. The NAGA DNA and protein sequences of the invention are useful for studying the expression and function of NAGA and for screening candidate drugs to treat diseases related to NAGA activity. The NAGA gene polymorphisms identified in the present invention are useful for haplotyping and genotyping the NAGA gene of an individual. The present DNA sequence represents an N-acetylgalactosaminidase gene allelespecific oligonucleotide primer New genetic variants of isolated N-acetylgalactosaminidase (NAGA), gene, useful for therapeutic purposes, for studying the expression function of the polynucleotide, and for expressing NAGA protein. ```
The present invention relates to a new method for determining the genetic affinity of organisms or viruses in the test sample. The method involves confernitying the closest known genetic relatives of the organisms or virus confernitying the closest known genetic relations of genetic by determining which nodes in the bifurcating tree of genetic consetul in identifying the phylogenetic affinity of an unknown organism cuseful in identifying the phylogenetic affinity of an unknown organism cuseful for unanticipated problems involving microorganisms that concerns space flight, medicine, indoor air quality, bloweapons of mass consequences are useful in the chybridisation to determine the phylogenetic tree positions of the chybridisation to determine the phylogenetic tree positions of the chybridisation to determine the phylogenetic tree positions of the chybridisation to determine the phylogenetic tree positions of the chybridisation to determine the phylogenetic tree positions of the nected as soluted. TRNA was enriched using DNAse and RNA fragmented by heating. Probes specific to several known bioterrorism agains of negative results. Molecular beacon based scoring of signature sequences reveals the presence of unexpectedly high concentrations of bacteria with genetic affinity to genes and selfinity of organisms in the test sample. The methodology is more general than the specifically targeted tests of the Kohne approach, and faster and more convenient than detailed sequence sequences of the rNAMs or their encoding DNA. The present nucleic acid sequence represents an RNA sequence that was used in the methods of the invention for sample identification

The sequences given in ABQ80141-52 represent primers which were used to identify wild type and variant loci in the human interleukin 4 receptor identify wild type and variant loci in the human interleukin 4 receptor (IL4R). These primer sequences were used in the method of the invention of comprises detecting the presence of an insulin dependent diabetes mellitus (IDDM) -associated interleukin 4 receptor allele in a nucleic or display ample of the individual, where the presence of the allele in a nucleic the individual where the presence of the allele in a nucleic the single nucleotide polymorphism (SNP) within the IL4R gene listed in the individual's risk for type 1 diabetes. The method identifies one or not single nucleotide polymorphism (SNP) within the IL4R gene listed in individual's risk for type 1 diabetes. The IL4R SNP's are also useful for determining an individual's risk for any autoimmune disease or condition or any T helphet type 1 mediated disease, e.g. rheumatoid arthritis, multiple sclerosis, inflammatory bowel disease, systemic lupus erythematosus, psoriasis, scleroderma, Grave's disease, systemic individual's risk in scleroderma, Grave's disease, or Hashimoto's contraction or Hashimoto's contraction or Hashimoto's contraction or many many many many sclerolesma, Grave's disease, or Hashimoto's contractions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Determining an individual's risk for type 1 diabetes, comprises detecting
the presence of an insulin dependent diabetes mellitus-associated
interleukin 4 receptor allele in a nucleic acid sample of the individual.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to in vitro identification (MI) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression. (MI) is useful for identifying genes involved in skin homeostasis, to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn, psoriasis, scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea, melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag

(M1) is useful for identifying genes involved in skin homeostasis; to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriais; scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; ichthyosis; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (EST) of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                RT-PCR; primer; amplification; reverse transcription; RNA fingerprinting; differential gene expression; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against
Human, skin, dermatological, vulnerary, antipsoriatic, antiseborrhaeic,
immunosuppressive, antiinflammatory, cytostatic, SAGE, neurodermatitis,

DEL MONTE TABOR

```
The invention provides a method for the differential screening of gene expression by random primed reverse transcription PCR (RT-PCR). The primer sequences are generated by stimulating PCR reactions on norredundant mammalian nuclectide sequence databank entries containing at least 1,000 bp of coding region. The primers selected, such as the present one, had to meet various criteria such as having an efficiency index between 2-10, having a selectivity index higher than 1, being 12 pp long i.e. 8 C or G and 4 T or A, and each primer differed from the others in at least 5 of the 8 bases at the 3'-and. The invention claims the selected primers make it possible to use internally primed, PCR-based RNA differential gene expression as an advantageous alternative to differential display. The method can also be useful for isolating new coding sequences and to compare known and new genes
                                                                                                                                                                           Differential screening of gene expression by reverse transcription polymerase chain reaction - uses random priming with primers selected for high efficiency and selectivity by computer screening of database(s).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically precreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010
                                                                                                   This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) cligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The cligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The cligomers are also used for detecting cell type differentiation. ABC00010-ABC99899, ABF00010-ABF99989, ABH0010-ABF99989 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

This invention describes a novel method for generating an antisense library targeted to a selected RNA transcript. The methods can be used for identifying target sites for antisense agents and for identifying target sites for antisense-mediated inhibition of a selected gene. The use of a direct library for target site selection significantly simplifies the screening process, ance only very small libraries need be prepared and assayed. AAZ22783-Z23798 represent RNA fragments derived from the Herpes simplex virus genome which are used to illustrate the method of the invention
-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIFO at the print electronic format from WIFO at

                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to methods for detecting the quantity of viral genomes in a blood sample. To illustrate the method Hepatitis C viral levels from patient blood serum samples were measured. A retroviral vector, which contained a modified sequence of hepatitis C virus (used as an internal standard was optained from the culture of packing cells by gathering the cultivation medium where cells were growing. The presence of resistance gene to puromic in the vector allowed detection of the titer of standard, s viral particles in experiments on infecting the cell cultures. The present oligonucleotide was used to illustrate the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Peptide nucleic acid, PNA, nucleic acid zygosity, genetic analysis;

The present invention relates to combination oligomers, including block synthesis of combination of oligomers in the absence of a template. The invention relates to a composition comprising a polymucleobase strand and a combination oligomer comprising first and second oligomer blocks that are each independently a peptide nucleic acid (PNA) covalently linked to each other by a linker of at least three atoms in length, where the oligomer blocks are sequences specifically hybridised to a target sequence of contiguous nucleobases in the polymucleobase strand, to form a double stranded target sequence-oligomer complex. The composition is cused for determining a target sequence of contiguous nucleobases and for determining the zygosity of a nucleic acid for a single nucleotide of polymorphism (SNP). The methods are useful in scientific investigation, complexing the zygosity of a nucleic acid for a single nucleotide of polymorphism (SNP). The methods are useful in scientific investigation, contrasts and pathogens in food, beverages, water, pharmaceutical products, viruses and pathogens in food, beverages, water, pharmaceutical products, contiguent, animal, human or environmental origin. They are also useful for the analysis of raw materials, equipment, products or processes used to manufacture or store food, beverages, water, pharmaceutical products, contiguous and materials are useful in areas such as expression analysis, such analysis, genetic analysis of humans, animals, fungi, yeast viruses contiguence is a PNA probe used for evaluation of combination oligomers. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Composition for determining target sequence of contiguous nucleobases, comprises polynucleobase strand and combination oligomer comprising first and second oligomer blocks that are covalently linked to each other.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Coull JM,
```

```
The present invention relates to combination oligomers, including block synthesis of combination of oligomers in the absence of a template. The invention relates to a composition comprising a polynucleobase strand and a combination oligomer comprising first and second oligomer blocks that are each independently a peptide nucleic acid (PNA) covalently linked to each other by a linker of at least three atoms in length, where the oligomer blocks are sequences specifically hybridised to a target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Composition for determining target sequence of contiguous nucleobases, comprises polynucleobase strand and combination oligomer comprising first and second oligomer blocks that are covalently linked to each other.
                                                                                                                                                                                                 /mod_base= OTHER

a double stranded target sequence-oligomer complex. The composition is used for determining a target sequence of contiguous nucleobases and for determining the zygosity of a nucleic acid for a single nucleotide polymorphism (SNP). The methods are useful in scientific investigation, e.g., for detection, identification and/or enumeration of bacteria, viruses and pathogens in food, beverages, water, pharmaceutical products, personal care products, dairy products, in clinical samples or in samples of pathogens in food, beverages, water, pharmaceutical products, of plant, animal, human or environmental oxigin. They are also useful for the analysis of raw materials, equipment, products or processes used to manufacture or store food, beverages, water, pharmaceutical products, personal care products dairy products or environmental samples. The methods and materials are useful in areas such as expression analysis, SNP analysis, genetic analysis of humans, animals, fungl, yeast viruses and plants, therapy monitoring, pharmacogenetics, pharmacogenetics, epigenomics and high throughput screening operations. The present epigenomics and high throughput screening operations. The present envaluation of combination oligomers. This sequence is a PNA probe used for evaluation of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /mod_base= OTHER

The present invention relates to combination oligomers, including block sytthesis of combination of oligomers in the absence of a template. The invention relates to a composition comprising a polymucleobase strand and a composition oligomer comprising first and second oligomer blocks that are each independently a peptide nucleic acid (PNA) covalently linked to each other by a linker of at least three atoms in length, where the cligomer blocks are sequences specifically hybridised to a target sequence of contiguous nucleobases in the polymucleobase strand, to form a double stranded target sequence-oligomer complex. The composition is consed for determining a target sequence-oligomer complex. The composition is determining the zygosity of a nucleic acid for a single nucleotide colymorphism (SNP). The methods are useful in scientific investigation, colymorphism (SNP). The methods are useful in scientific investigation, colymorphism (SNP). The methods are useful in scientific investigation, colymorphism in food, beverages, water, pharmaceutical products, viruses and pathogens in food, beverages, water, pharmaceutical products, of plant, animal, human or environmental origin. They are also useful for the analysis of taw materials, equipment, products or processes used to personal care products dairy products or environmental samples. They are also useful for methods and materials are useful in areas such as expression analysis, sentents analysis of humans, animals, fungi, yeast viruses and plants, therapy monitoring, pharmacogenedics, pharmacogenetics, and plants, therapy monitoring, pharmacogenedics, pharmacogenetics, cand plants, therapy monitoring, pharmacogenedics, pharmacogenetics, ceptigenomics and high throughput screening operations. The present complement of sequence is a PNA probe used for evening operation of the invention coligomers.
                                                                                                                                                                                                                                                  Composition for determining target sequence of contiguous nucleobases, comprises polynucleobase strand and combination oligomer comprising first and second oligomer blocks that are covalently linked to each other.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SAGE tag; serial analysis of gene expression; antigen-presenting cell; APC; moncoyte-derived dendritic cell; differential gene expression; immunostimulatory cofactor; costimulatory factor; CTL; cytotoxic T-lymphocyte; tumour antigen; immunotherapy; anticancer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Expression) tagg used to identify mRNA transcripts encoding coxpression) tagg used to identify mRNA transcripts encoding coxpression) tagg used to identify mRNA transcripts encoding differentially expressed in monocytes. Preferentially compared differentially expressed in monocytes. Some of the transcripts correspond to known genes or ESTS (expressed sequence tags) which were previously unknown to be preferentially or differentially expressed in dendritic cells, while cother transcripts correspond to novel genes. Antigen-presenting cell cativation of the cytotoxic immune response, particularly against tumour cells. Tumour antigen presentation via the MHC (major histocompatibility complex) and subsequent recognition by T-cell receptors is alone insufficient to activate a robust cytotoxic immune response that can lyse the tumour cells, immunostimulatory cofactors also being required for efficient activation of cytocoxic Tlymphocytes (CTLS). Nucleic can lyse complexication of cytocoxic Tlymphocytes (CTLS). Nucleic acid sequences identified using the SAGE tags have several potential uses. They may be used in vaccines to induce an immune response that can lyse cagainst a tumour antigen; to endulate the genotype of an APC; to screen for agents that modilate expression of differentially expressed genes in a APC; and as hybridisation primers for the dendritic cell differentially expressed genes. Occupancy in a probe and monitoring of diseases related to abnormal capsessed genes, or of their encoded proteins, can be used to identify calls as belonging to the monocyte lineage. Cells containing these genes can be used in active immunotherapy (or to stimulate production of a population of antigen-specific effector cells) and vectors containing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Isolated polynucleotides differentially expressed in antigen-presenting cells, useful in gene vaccines against cancer.

The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAM63161. Ath64724 is expressed by the cell. The transcriptomes described in the invention are cell-type specific, cancer specific or ubsquitously expressed in humans. They can also be used to screen for drugs, reduce cancer specific gene expression, standardise expression and restore the function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                            New isolated polynucleotides, useful for identifying specific cell type, such as cancer cell, comprises transcriptomes expressed in particular
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 11; Page 66; 94pp; English.

                                                                                                                                                                                                                                                                                                                  Expression) tags used to identify mRNA transcripts encoding compression) tags used to identify mRNA transcripts encoding compressed in monocyte-derived dendritic cells compared differentially expressed in monocyte-derived dendritic cells compared with monocytes. Some of the transcripts correspond to known genes or ESTS (expressed sequence tags) which were previously unknown to be preferentially or differentially expressed in dendritic cells, while cher transcripts correspond to novel genes. Antigen-presenting cell corporation of the cytotoxic immune response, particularly against tumour complex, and subsequent recognition by T-cell receptors is alone activate as robust cytotoxic immune response that can lyse complex, and subsequent recognition by T-cell receptors is alone insufficient to activate a robust cytotoxic immune response that can lyse the tumour cells, immunostimulatory cofactors also being required for cefficient activation of cytotoxic T-lymphocytes (CTLS). Nucleic acid sequences identified using the SAGE tags have several potential uses. Genes tumour antigen; to modulate the genotype of an APC; to screen to capture that modulate expression of differentially expressed genes in the approach of the containing of diseases related to abnormal expression of these genes. Detection of the dendritic cell differentially expressed genes, or of their encoded proteins, can be used to identify calls as belonging to the monocyte lineage. Cells containing these genes in the are used in active immunotherapy (or to ctimulate production of a colls and promine of antigen-specific effector cells and promine of antigen-specific effector cells and promine of the monocyte or cells and promine of the monocyte or cells and promine or cells and promine and containing the encoded processed genes or of their encoded promine. The containing these genes cells are also become the

The present invention provides the protein, gene and cDNA sequences of the human potassium voltage-gated channel. Shab-related subfamily, member 1 (KCNB1) isogene and polymorphisms identified within these sequences. The sequences can be used to screen drugs, which involves contacting the polypeptide with a candidate agent, and to assay for binding activity as a target for drugs to treat arthythma and seizures. The present sequence is a primer extension oligonucleotide described in the invention

WPI; 2002-393942/42

Novel genetic variants of soluble carrier family 18 (vesicular monoamine), member 2 gene useful for screening drugs to treat diseases e.g. neuropsychiatric disorders involving monoaminergic brain systems.

Claim 19; Page 15; 183pp; English

The present invention describes an isolated polynucleotide (I) having a sequence (SI) comprising soluble carrier family 18 (vesicular monoamine), member 2 (SLC1822) isogenee selected from 49 isogenees with respices of a sequence (SS) of 40023 bp (see ABL51954), and defined by a corresponding set of polymorphisms whose locations and identities are given in the specification; or a sequence (SS) complementary to (SI). (I) has antithflammatory and neuroleptic activities, and can be used in gene therapy. Methods from the present invention can be used for haplotyping and genotyping the SLC18A2 gene in an individual. SLC18A2 is also known as the vesicular monoamine transporter (WAAT2). (I) is useful in studying the expression and function of SLC18A2, and in expressing the SLC18A2 activity and in studying the effect of the variation on the biological activity of SLC18A2 seel is so the binding affinity of candidate drugs targeting SLC18A2 for the treatment of respiratory RESULT 59

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically schoded from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis, to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis, sunburn, psoriasis; scleroderma; inchthyosis; atopic dermatitis, acne, seborrhea; lupus erythematosus; rosaces, melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag
             monoaminergic brain systems. The present sequence represents a preferred oligonucleotide primer for human SLC18A2, which is given in the present
                                                                                                                                                                                                                                                                                                                                                                                                                           Human, skin, dermatological, vulnerary, antipsoriatic, antiseborrhaeic, immunosuppressive, antiinflammatory; cytostatic, SAGE, neurodermatitis, psoriasis, dermatitis, skin cancer, EST; expressed sequence tag, ss.

The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis; to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma; icthhyosis; atopic dermatitis; acne; seborrhas; lupus erythematosus; rosace, melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (EST) of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                         In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression.

(M1) is useful for identifying genes involved in skin homeostasis; to determine skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis, scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (EST) of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    RESULT 65
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              g
                                                                                                                                              The invention relates to a method for producing polymucleotides having a defined sequence using rolling templates that successively add nucleotides (ints) to a longer primer strand. The method comprises: (i) incubating, under ammealing conditions, a primer and a template that has a 5'-region not complementary to the primer, a 3'-region complementary to the primer, with the template the ingressor of primer and a non-reactive 3'-reminus, with the template of the ing shorter than the primer; (ii) reacting the primer with at least one in presence of a template-dependent polymucleotide polymerase to at its 3'-end; (iii) separating the template and the extended primer; and (iv) repeating the cycle of (i)-(iii) as often as needed to synthesize the desired polymucleotide. The method is especially used to produce genes or their segments. The method is especially used to produce genes or their segments. The method is especially used to produce synthesis of RNA or DNA and is more efficient than chemical coupling processes. It has higher specificity and eliminates the need for deprotection. The products can be cloned directly. The method avoids problems of waste disposal and includes an inherent editing effect. (failure sequences will not be extended further in subsequent rounds so that purification of the end product is facilitated. Synthesis may take place on a vector, simplifying cloning and sequences with codon usage optimized for a particular host can be prepared
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

The invention relates to a method for producing polynucleotides having a defined sequence using rolling templates that successively add nucleotides (IIs) to a longer primer strand. The method comprises: (i) incubating, under annealing conditions, a primer and a template that has a 'region not complementary to the primer, a 3'-region complementary to the 3'-reminus, with the template being shorter than the primer; (ii) reacting the primer with at least one to in presence of a template-dependent polymucleotide polymerase to the in presence of a template-dependent polymucleotide polymerase to the integral of the primer; and (iv) repeating the cycle of (i)-(iii) as often as needed to synthesize the desired polymucleotide. The method is especially used to produce the desired polymucleotide. The method provides fast, accurate, inexpensive synthesis of RNA or DNA and is more efficient than chemical coupling problems of waste disposal and includes an inherent editing effect problems of waste disposal and includes an inherent editing effect problems of waste disposal and includes an inherent editing effect that purification of the end product is facilitated. Synthesis may take place on a vector, simplifying cloning and sequences with codon usage openialized for a particular host can be prepared
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Growth hormone system; Kruppel system; TAT system; OU system; asymmetric hammerhead ribozyme; cleavage; viral infection; bacterial; neoplastic; psoriasis; ss.

New asymmetric hammerhead ribozymes have been developed, of the formula:

5'-(N)n'NNN-C-U-G-A-[N-G-A-(N)a-(N)m-P-(N)m-G-A-A-ANDNNNN(N)n-3', where
N = a nuclectide which may be substituted or modified in its sugar, base
or phosphate provided not every N is a ribonuclectide; the hybridising
arms 3'-(N)nNNNNNA and NNN (N)n-5' are each an oligonuclectide (ON)
having a prederamined sequence which is complementary to an RNA target
capture to be cleaved; n and n' = an integer which defines the number of
nuclectides in the ON with the proviso that n =1-5 and n' = 1 to 3; each
solid line represents chemical linkage providing ovorlent bonds between
the nuclectides located on either side; a = an integer which defines a
number of nuclectides with the proviso that a may be 0 or 1 and if 0, the
loop of the compound each m and m' = an integer which is greater than 2;
p = a non-nuclectide linker or a nuclectide linker (N)b, where (N)b
represents an ON which may be present with the proviso that b = an
ribozymes can be used for cleaving RNA target sequences. They can be used
for cleaving diseases (e.g. viral or bacterial infections, neoplastic
conditions, or psoriasis). They can also be used as diagnostics, e.g. to New asymmetric hammerhead ribozymes - used for cleaving target RNA for treating e.g. viral or bacterial infection, neoplastic conditions or Disclosure; Page 34; 49pp; English gene mapping psoriasis

The present invention describes an array of nucleic acid probes

comprising probes with a segment of at least 6 nuclectides complementary

comprising probes with a segment of at least 6 nuclectides complementary

to the CFTR (cystic fibrosis transmembrane conductance regulator) gene,

where the segment includes at least 1 interrogation position

complementary to a nuclectide in the CFTR gene sequence; and (2) second,

third and fourth probe sets, each comprising probes identical to those in

chird and fourth probe sets, need to moprision is occupied by a different

contlementary to AAAO6391 to present CFTR gene analysis a

cuclectide. AAAO6391 to passent CFTR gene analysis a

controlled probes for use in the exemplification of the present

invention. The present invention also describes a method of comparing a

crarget nucleic acid with a reference sequence consisting of comparing a

crarget nucleic acid with a reference sequence consisting of a

probes inmobilised on a solid support; (b) comparing the relative

crapt moding of two corresponding probes from the first and second

probe sets; (c) assigning a nucleotide in the target sequence as the

complement of the interrogation position of (b) by comparing the relative

craptic binding; and (d) repeating (b) and (c) by comparing the relative

craptic binding; and (d) repeating (b) and (c) by comparing the first and

second probe sets until each nucleotide of interest in the target

sequence has been assigned. The array is useful for analysis of the CFTR

crays and the corresponding of the array is useful for analysis of the CFTR

This sequence represents a detection probe that can be used in the composition of the invention. The composition comprises an electrode with composition of the invention. The composition comprises an electrode with composition of the invention of conductive oligomers (1) and insulators, and a covalently attached capture binding ligand. The composition is cused: (1) for environmental or clinical assays, for practically any analyte for which a ligand is available, e.g. pesticides, therapeutic or illicit drugs, hormones, immunoglobulins, nucleic acids, tumour or other cells, bacteria, viruses, antigens; (2) to screen for potential cells, bacteria, viruses, antigens; (2) to screen for potential composition analysis, e.g. detecting disease-associated genes or mutations; (4) for forensic fingerprinting; and (5) to detect successful amplification in polymerase chain reactions. Electron transfer molecules (ETMs) can be detected directly on the surface of (4) containing (1). (A) shield the electrode from solution components and reduces the degree of sensitivity, e.g. 20-50 per recruitment linker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Probe; electron transfer moiety, ETM; detection; amplification;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
                                                                                                                                           This sequence represents a detection probe that can be used in the composition of the invention. The compositions comprise: (a) an electrode compositions of the invention. The compositions comprising it is a monalwayer comprising of an electrode comprising; (i) a monalwayer comprising is an electrode capture probe; and either (b) a target sequence comprising a portion that can hybridize to the probe and has at least 1 covalently attached electron transfer moiety (ETM); or (c) a label probe comprising a portion that can hydridise to a component of an assay complex and a second portion to hydridise to an assay complex component and has at least 1 covalently attached ETM. The probes are useful for the detection of a target nucleic acid sequences in complex genetic diagnostics, viral or bacterial detection, forensic 'DNA fingerprinting', and for detecting successful gene amplification in PCR. The ETM's can be used as intermediates in the preparation of metallocene-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                            Components for the electronic detection of nucleic acids using conductive oligomers monolayers linked to probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Detection probe; electronic detection; conductive oligomer; label probe; capture probe; nucleic acid detection; microorganism detection; genetic analysis, disease-associated gene detection; mutation detection; forensic fingerprinting; gene amplification detection; electron transfer molecule; ss.

lor 2 metal complexes as electron transfer moleties (ETMs). Experiments were performed to compare different ETM attachments. A detection probe complementary to the detection probe) and negative (i.e. probes not complementary to the detection probe) and negative (i.e. probes not complementary to the detection probe) control labels were added. The electrodes were used in AC detection methods. The invention relates to methods useful in the detection of nucleic acids using a variety of amplification techniques, including both signal amplification and target amplification. Detection proceeds through the use of an ETM, preferably a metallocene and especially a ferrocene, that is associated with the nucleic acids, either directly or indirectly, to allow electronic detection of the ETM using an electrode. The extremely sensitive and specific probes can detect target sequences without removal of unhybridised probe, and are useful in a variety of forensic (e.g. DNA fingerprinting), research, clinical (e.g. genetic diagnosis), quality
                                                                                                                                                                                                                                                                                                                                                                                                                  ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Determining differential display of gene expression, useful for monitoring drug responses at the gene expression level and locating genes involved in a particular response, by comparisons between mono-length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAZ39834-38 represent target oligonucleotides which were used to test for complementarity binding on three different types of membrane, in the course of the invention. The specification describes a method of determining differential display of gene expression, by comparison of mono-length cRNA libraries. These libraries are probe hybridised to accessible ordered arrays to determine differential hybridisation display sites between mono-length segment libraries and to locate genes of expression differential. The methods are useful for determining differential hybridisation display sites between mono-length segment
                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Mono-length cDNA library; differential display; gene expression; gene identification; drug response; ss.

complementarity binding on three different types of membrane, in the complementarity binding on three different types of membrane, in the course of the invention. The specification describes a method of determining differential display of gene expression, by comparison of mono-length cRNA libraries. These libraries are probe hybridised to accessible ordered arrays to determine differential hybridisation display segment libraries and to locate genes of expression differential. The methods are useful for determining ciferential hybridisation display sites between mono-length segment libraries and to locate genes of expression differential. The methods are useful in gene identification related to complex traits. The methods also useful in gene identification related to complex traits. The methods also bermit monitoring drug responses at the gene expression level and cotating genes involved in a particular response. The methods are also useful for pharmacogenomic research in evaluating how variability in genetic background influences positive or negative response to a drug
                                                                                                                                                                                                              ..

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF9989, ABF00010-ABF9989, ABF00010-ABF9989, ABF00010-ABF99999, ABF00010-ABF99999 and ABI00010-ABF99999 as obtained in electronic form part of the printed specification, but the wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and oytosine methylation status in chemically pretreated genomic DNA. The oligomucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99889, ABF00010-ABF99889, ABH00010-ABF99889 and ABI00010-ABF8073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

designed to detect single-nucleotide polymorphisms and cytosine methylation status.

Claim 1; SEQ ID NO 286488; 29pp + Sequence Listing;

```
This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The coligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The coligomers are also used for detecting cell type differentiation. ABC00010-ABC99899, ABF00010-ABF99899, ABF00010-ABF99899 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Oligonucleotide primer SEQ ID NO 286488 for detecting SNP TSC0012735.
                                                                                                                                                                                set or oligonucleotides, useful for diagnosis and cell typing, i designed to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                              Claim 1; SEQ ID NO 286507; 29pp + Sequence Listing; German.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytoshie methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting call type differentiation. ABC00010 -ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073
                                                                              This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretraated genomic DNA. The oligonucleotides are used for disgnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting call type differentiation. ABC0010-ABC99989, ABF00010-ABH99989 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretracted genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC099889, ABC00100-ABE99889, ABC0010-ABE99889 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence are obtained in electronic format from WIPO at the printed specification, but the wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at ftp.wipo.int/pub/published_pct_sequences

The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99889, ABF00010-ABF99989, ABH00010-ABF99989 and ABI00010-ABI82073 tapmers the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at the printed specification, but the wipo.int/pub/published_pct_sequences

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HEV) or Hepatitis B virus (HEV) or an entaymetic acids such as harmerhead ribozymes, DNAzymes, and enzymatic nucleic acids such as harmerhead ribozymes, DNAzymes, CC are nucleic acid decoup molecules and aptamers that bind to HBV reverse transcriptase primer sequences, as well transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or infection of HCV. The compounds and methods of the invention and dor nethods of the invention and dor the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a target for one of the anti-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      16S rRNA; probe; detection; procine atrophic rhinitis; hybridisation;

The fragments are used as probes to detect portine atrophic rhinitis caused by the Bordetella bronchiseptica bacterium. Also claimed are 3 DNA fragments complementary to the 436-466 region of the 165 rRNA (AAAGA032-034). A specific DNA segence from the SI rRNA was selected and 2 probes were designed (AAAG4035 and AAQ64039) for the detection of B. bronchiseptica. Primers (AAAG4035 and AAQ64039) for clone the 165 gene. Sequences (AAAG4034) is the preferred probe used to the detection process. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                   B.bronchiseptica 16s rRNA fragments - used as probes in the detection of porcine atrophic rhinitis.
                                                                                                                                                                                                                                                                                       (AAQ64009-Q64031) are fragments of the 16S rRNA gene from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SAGE tag, serial analysis of gene expression, antigen-presenting cell, APC, moncoyte-darived dendritic cell, differential gene expression, immunostimulatory cofactor, costimulatory factor, CTL, cytotoxic T-lymphocyte, tumour antigen, immunotherapy, anticancer; ss.

Sequences AAZ7573-Z79709 represent SAGE (Bernal analysis of gene expression) tags used to identify mRNA transcripts encoding immunostimmlatory coffactor proteins which are preferentially or differentially expressed in monocyte-derived dendritic cells compared with monocytes. Some of the transcripts correspond to known genes or ESTS (expressed sequence tags) which were previously unknown to be preferentially or differentially expressed in dendritic cells, while or preferentially or differentially expressed in dendritic cells, while or ther transcripts correspond to novel genes. Antigen-presenting cell other transcripts correspond to novel genes. Antigen-presenting cell other transcripts correspond to novel genes. Antigen-presenting cell or their transcripts correspond to novel genes. Antigen-presenting cell or their antigen presentation via the MEC (major histocompatibility complex) and subsequent recognition by T-cell receptors is alone cells. Thumour antigen presentation via the MEC (major histocompatibility complex) and subsequent recognition by T-cell receptors is alone certivation of cytotoxic T-lymphocytes (CTES). Nucleic can lyse the tumour cells, immunostimulatory coffectors also being required for the tumour cells, immunostimulatory coffectors also being required for the tumour antigen; to modulate expression of diseases (corresponse, particularly sequences identified using the SAGE tags have several potential uses. They may be used in vaccines to induce an immune response, particularly against a tumour antigen; to modulate expression of these genes, or of their encoded proteins, can be used to a prognosis and monitoring of diseases related to abnormal expression of these genes. Detection of the dendritic cells containing them are used in active immunotherapy (or to stimulate production of the progness and monitoring of diseases related to abnormal component or endogenous APCs and upregulates the APCs for the presentation of costimulatory factors ensures adequate antigen factor cells or presentation of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      solated polynucleotides differentially expressed in antigen-presenting

expression) tags used to identify many transcripts encoting appression) tags used to identify many transcripts encoting to immunostimulatory cofactor proteins which are preferentially or differentially expressed in monocyte-derived dendritic cells compared with monocytes. Some of the transcripts correspond to known genes or ESTS (expressed sequence tags) which were previously unknown to be preferentially or differentially expressed in dendritic cells, while preferentially or differentially expressed in dendritic cells, while confort transcripts correspond to novel genes. Antigen-presenting cell (APC) -associated costimulatory factors play an important role in the cell varion of the cytotoxic immune response, particularly against tumour antigen presentation via the MMG (major histocompatibility complex) and subsequent recognition by T-cell receptors is alone insufficient to activate a robust cytotoxic immune response that can lyse complex) and subsequent recognition by T-cell receptors is alone insufficient to activate a robust cytotoxic immune response that can lyse complex) and subsequent recognition by T-cell receptors is alone for the tumour calls, immunostimulatory coffectors also being required for efficient activation of cytotoxic T-lymphocytes (CTLs). Nucleic acid sequences identified using the SAGE tags have several potential uses. They may be used in vaccines to induce a numnum response, particularly capanosis and monitoring of diseases related to abnormal expression of their encoded proteins, can be used to identify expression of their encoded proteins can be used to active immunotherapy (or to stimulate production of a containing them are used in active immunotherapy (or to stimulate production of active immunotherapy. Co-administration of tumour antigen and expression of co-stimulatory factors ensures adequate antigen containing containing the presentation of o-stimulatory signals, migration of chemce of immune effector cells experience of them are used in gene therapy.                                                                                                                                                                                                                                                                                    that are preferentially transcribed in the metastatic breast tumour tissue (i.e. are upregulated in metastatic breast tumour cells). AAZ8942 to AAZ86677 represent tags corresponding to distinct transcribts that are preferentially transcribed in the primary or incomplete transcribts that are preferentially transcribed in the primary or non-metastatic breast tumour cells). These tissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for disquosis, prognosis, monitoring and transcripts can be used for disquosis, prognosis, monitoring and transcripts can be used for disquosis, prognosis, monitoring and transcripts are immunoasanys or hybridiaetion/amplification reactions. Or seful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell-based vaccines. Porpeptides encoded by the transcripts are also useful in vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic additions that produce the polypeptides can be used to expand and isolate populations of educated, antigen-epecific immune effecter

AA280767 to AA283941 represent tags corresponding to distinct transcripts that are preferentially transcribed in the metastatic breast tumour cella). AA28342 tissue (i.e. are upregulated in metastatic breast tumour cella). AA2863742 to AA286577 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour tells). These tissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and transcripts can modulate expression of the transcripts are potentially compounds that modulate expression of the transcripts are potentially compounds that modulate expression of the transcripts are potentially cuseful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of particularly an antigen encoded by the transcripts are also useful in cacines for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic and isolate populations of educated, antigen-specific immune effecter calls, e.g. cytotoxic T lymphocytes, and these used for adoptive immunotherapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

                                                                                                                                                                                                                                                                                     that are preferentially transcribed in the metastatic breast tumour tissue (i.e. are upregulated in metastatic breast tumour cells). AA28942 tissue (i.e. are upregulated in metastatic breast tumour cells). AA28942 to AA286677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cells). These tissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and transcripts are metastatic) breast cancer, while promoters from the transcripts are used to direct expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell-based vaccines, for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic agents. Host cells that produce the polypeptides can be used to expand and isolate populations of educated, and these used for adoptive cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

frequently in human monocytes. The CDNA of each game has a sequence fully defined in the specification, and lacking the CATG sequence located defined in the specification, and lacking the CATG sequence located adjacent to polyA region. Also described are: (1) an antibody specifically for the protein encoded by any of the genes; (2) oligonuclectides obtained from the cDNA sequences; (3) 380 human genes colory-stimulating factor, from human monocytes by granulocyte-macrophage colony-stimulating factor, the CDNA of each gene has a fully defined sequence, given in the specification, lacking the base sequence CATG located most closely to the CDNA region; (4) an antibody specifically for the protein encoded by any of the genes of (3); and (5) oligonuclectides obtained from the cDNA sequences of (3). The genes and cDNAs, are used for the study of gene specificially and disease onset mechanism e.g. oncogenesis, genetic diseases, drug development and diagnosis. AAA56107 to AAA56586 represent specifically claimed oligonuclectides sequences for human genes expressed in monocytes and macrophages
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ó
                                                                                                                                                                                                                                                                  The present invention describes 100 human genes, which are expressed most
                                                      Genes most frequently expressed in human monocytes and GM-macrophages M-macrophages studied and with cDNAs characterized, for study of gene specificity, disease onset mechanism, drug development and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human dendritic cell preferentially expressed SAGE tag, SEQ ID NO:142.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SAGE tag; serial analysis of gene expression; diagnosis; differential gene expression; characterisation; targetted expression; tumour; cancer; immunotherapy; ss.

The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAH63161.

AH64724 is expressed by the cell. The transcriptomes described in the invention are cell-type specific, cancer specific or ubiquitously expressed in humans. They can also be used to screen for drugs, reduce cancer specific gene expression, standardise expression and restore the function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated polynucleotides, useful for identifying specific cell type, such as cancer cell, comprises transcriptomes expressed in particular cell types.
                                                                                                      Human; transcriptome; gene expression pattern; cancer; drug screening; cancer diagnosis; cell specific gene expression; ss.
                                                            Human ubiquitously expressed transcriptome sequence SEQ ID NO: 406.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human normal hepatocyte expression gene cDNA, SEQ ID NO: 2.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ద
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequences AAZ79710-Z79916 represent SAGE (serial analysis of gene expression) tags used to identify mRNA transcripts which are differentially expressed in a variety of normal or malignant cell types. Some of the transcripts correspond to known genes or ESTS (expressed sequence tags) which were previously unknown to be preferentially or differentially expressed in that particular cell type, while other transcripts correspond to novel genes. The invention also provides a nucleotide comprising a promoter sequence derived from one of the foreign nucleotide sequence, and gene delivery vehicles and host cells comprising the polynucleotides of the invention. A nucleotide comprising the polynucleotides of the invention. A nucleotide comprising the polynucleotides of the invention. A nucleotide comprising sequences AAZ79710-Z79916 may be used in diagnostic procedures to comprising sequences AAZ79710-Z79916 may be used in diagnostic procedures to characterise a cell of a specific tissue type and to determine whether it is normal or malignant. They may be used to screen for agents that modulate expression of differentially expressed genes compound. The promoter foreign gene construct of the invention may be used for example, a promoter derived from a gene preferentially expressed in cargetted expression of the foreign gene in a particular cell type. For example, a promoter derived from a gene preferentially expressed in sequence encoding an antigen. Such a construct could be transduced into the construct could be used to the construct could be transduced into the construct could be used to the construct could be used to the construct could be transduced into the construct could
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ..

The present invention describes an isolated DNA molecule comprising a coding sequence of a year gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.
                                                                                                                       The invention relates to a human normal hepatocyte expression gene group comprising 200 genes in the human normal hepatocyte. The cDNA of each gene comprises one of 200 fully defined nucleotide sequences as given in the specification. The gene group and the cDNAs corresponding to each of the genes in the group are useful in the diagnosis and treatment of human hepatopathy. The present sequence is a cDNA corresponding to a gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Yeast, Saccharomyces cerevisiae, characterisation, cell cycle, NORF, nor previously assigned open reading frame, nonannotated ORF, SAGE, serial analysis of gene expression; antifungal; tag; identification;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Yeast NORF gene SAGE tag oligonucleotide SEQ ID NO:8333.

Kinzler K;

the yeast gene is a candidate antifungal drug; (3) a method (M3) for the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression comparising contacting human DNA with a probe which comprises at least 10 comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1; (2) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a yeast cell comprising contacting a yeast cell with a candidate drug and conting expression in the yeast cell of at least 1 NORF gene whose cervices of the class of drugs. The NORF genes may be used expression is affected by the class of the cell cycle, the differentially control and affect phases of the call cycle. The methods may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. Appliable to AAPA964 crepresent SAGE tags used in the exemplification of the present invention.

CAAPA33261 to AAPA3267 represent invention of the present invention. The invention relates to SAGE (serial analysis of gene expression) tags representing groups of genes which are differentially expressed in human chronic hepatities C (GH) liver tissue or hepatities C-induced the paparocellular carcinoma (HCC) compared with normal human liver tissue. The SAGE tags of this invention consist of a sequence of 10 nucleotides polyh region of CDNAs derived from a variety of genes. These tags serve to uniquely identify each transcript and can thus be used to analyse the pattern of gene expression in particular call types. The invention also relates to proceins encoded by the genes expressed in chronic hepatitis C liver tissue or HCC, antibodies against these proteins, and inhibitors of SAGE tag; serial analysis of gene expression; human; chronic hepatitis C; CH; liver tissue; hepatocellular carcinoma; cancer; tumour; HCC; expression pattern; differential expression; ss. Gaps Chronic hepatitis C/HCC differentially expressed gene SAGE tag #567. the expression of groups of genes that are overexpressed in chronic hepatitis C liver tissue or HCC. Groups of genes differentially expressed in chronic hepatitis C tissue or HCC may be used for the diagnosis and treatment of these diseases. Such genes, inhibitors of their expression or activity, and antibodies against the gene products may be used in the development of drugs to treat chronic hepatitis C and/or HCC. Sequences ABV84691-ABV84790 are SAGE tags representing the 100 least highly expressed genes out of those genes which are underexpressed in hepatocellular carcinoma compared with chronic hepatitis C liver tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                 SAGE tag; serial analysis of gene expression; human; chronic hepatitis C; CH; liver tissue; hepatocellular carcinoma; cancer; tumour; HCC; expression pattern; differential expression; ss.

the inventing groups of genes which are differentially expressed in human chronic hepatitis C (CH) liver tissue or hepatitis C-induced human chronic hepatitis C (CH) liver tissue or hepatitis C-induced human chronic hepatitis C (CH) liver tissue or hepatitis C-induced human liver tissue. The SAGE tags of this invention consist of a sequence of 10 nucleotides consist of a sequence of 10 nucleotides consist of a sequence of 10 nucleotides consist of a variety of genes tags serve to uniquely identify each transcript and can thus be used to analyse the pattern of gene expression in particular cell types. The invention also celles to proteins encoded by the genes expressed in chronic hepatitis C liver tissue or HCC, antibodies against these proteins, and inhibitors of the expression of groups of genes that are overexpressed in chronic hepatitis C tissue or HCC groups of genes differentially expression to these diseases. Such genes, inhibitors of their expression creatment of these diseases. Such genes, inhibitors of their expression creatment of these diseases. Such genes, inhibitors of their expression carvity, and antibodies against the gene products may be used in the development of drugs to treat chronic hepatitis C and/or HCC. Sequences ABV8450 are SAGE tags representing the 100 least highly invention relates to SAGE (serial analysis of gene expression) ABV84491-ABV84590 are SAGE tags representing the 100 least hig expressed genes out of those genes which are underexpressed in Claim 28; Page 20; 139pp; Japanese

```
The invention relates to SAGE (serial analysis of gene expression) tags representing groups of genes which are differentially expressed in human chromic hegatitis C (CH) liver tissue or hepatitis C-induced in human liver tissue. The SAGE tags of this invention consist of a sequence of 10 nucleotides content expected downstream of the 5'-CATG-3' sequence motif lying nearest to the polyh region of cDNAs derived from a variety of genes. These tags serve to uniquely identify each transcript and can thus be used to analyse the pattern of gene expression in particular cell types. The invention also relates to proteins encoded by the genes expressed in chronic hepatitis C liver tissue or HCC, antibodies against these proteins, and inhibitors of the expression of groups of genes that are overexpressed in chronic hepatitis C liver tissue or HCC (aroups of genes differentially expressed in chronic hepatitis C liver tissue or HCC may be used for the diagnosis and treatment of these diseases. Such genes inhibitors of their expression or activity, and antibodies against the gene products may be used in the development of drugs to treat chronic hepatitis C and or activity, and antibodies against the gene products may be used in the development of drugs to treat chronic hepatitis C and/or HCC. Sequences apply expressed in expression or activity, and antibodies against the gene products may be used in the expression or activity, and antibodies against the gene products may be used in the average and antibodies against the gene products may be used in the expression or activity, and antibodies against the gene products may be used in the expression or activity and antibodies against the gene products may be used in the expression or activity.

The invention relates to SAGE (serial analysis of gene expression) tags representing groups of genes which are differentially expressed in human chromatch departitis (CH3) liver tissue or hepartitis C-induced human liver tissue. The SAGE tags of this invention consist of a sequence of 10 nucleotides clocated downstream of the S'-CATG-3' sequence motif. Tying nearest to the polyh region of the S'-CATG-3' sequence motif. Tying nearest to the polyh region of the S'-CATG-3' sequence motif. Tying nearest to the polyh region of the Street from a variety of genes . These tags serve to uniquely identify each transcript and can thus be used to analyse the partice of pattern of gene expression in particular cell types. The invention also relates to proteins encoded by the genes expressed in chronic hepatitis C liver tissue or HCC, antibodies against these proteins, and inhibitors of the chronic hepatitis C liver tissue or HCC may be used for the diagnosis and in chronic hepatitis C liver tissue or HCC may be used for the diagnosis and creativity, and antibodies against the gene fare the diagnosis and creativity, and antibodies against the gene products may be used in the development of drugs to treat chronic hepatitis C and/or HCC. Sequences ABVEG-691, ABV84451-ABV84790 are SAGE tags representing the 100 least highly expressed genes out of those genes which are underexpressed in hepatocellular carcinoma compared with chronic hepatitis C liver tissue

```
The invention relates to SAGE (serial analysis of gene expression) tags crepresenting groups of genes which are differentially expressed in human chronic hepatitis C (CH) liver tissue or hepatitis C-induced hepatocellular carcinoma (HCC) compared with normal human liver tissue. The SAGE tags of this invention consist of a sequence of 10 mucleotides C the SAGE tags of this invention consist of a sequence of 10 mucleotides C polyA region of CDNA region of CDNA derived from a variety of genes. These tags serve to uniquely identify each transcript and can thus be used to analyse the pattern of gene expression in particular cell types. The invention also c relates to proteins encoded by the genes expressed in chronic hepatitis C liver tissue or HCC, antibodies against these proteins, and inhibitors of the expression of groups of genes that are overexpressed in chronic c hepatitis C liver tissue or HCC. Groups of genes differentially expressed in chronic hepatitis C tissue or HCC. Groups of genes differentially expressed in chronic decelopment of these diseases. Such genes, inhibitors of their expression c ractivity, and antibodies against the gene products may be used in the ABV84191-ABV841990 are SAGE tags representing 100 genes which are highly expressed in chronic hepatitis C liver tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The invention relates to SAGE (serial analysis of gene expression) tags representing groups of genes which are differentially expressed in human charactise (CH) liver tissue or hepatitis C-induced to hepatocellular carcinoma (HCC) compared with normal human liver tissue.

The SAGE tags of this invention consist of a sequence of 10 nucleotides located downstream of the 5'-CAPTG-3' sequence motif lying nearset to the polyh region of the 5'-CAPTG-3' sequence motif lying nearset to the polyh region of cDNAs derived from a variety of genes. The invention also calates to proteins encoded by the genes expressed in chronic hepatitis C liver tissue or HCC, antibodies against these proteins, and inhibitors of the expression of groups of genes there expressed in chronic hepatitis C liver tissue or HCC (Groups of genes differentially expressed in chronic hepatitis C liver tissue or HCC (Groups of genes differentially expressed in chronic hepatitis C liver tissue or HCC (Groups of genes differentially expressed in chronic hepatitis C liver tissue or HCC (Groups of genes differentially expressed in chronic hepatitis C liver tissue or HCC (Groups of genes differentially expressed in chronic hepatitis C liver tissue or HCC (Groups of genes differentially expressed in chronic hepatitis C liver tissue or HCC (Groups of genes differentially expressed or cractivity, and antibodies against the gene products may be used in the development of drugs to treat chronic hepatitis C and/or HCC. Sequences C ABVM8491-ABVM8490 mas EAGE tags representing 100 genes which are highly considered in the care of the constant of the care of the constant of the care chronic hepatitis C and/or HCC. New small inducible cytokine subfamily B (Cys-X-Cys), Member 14 (SCYB14) gene polymorphic variants, for studying the expression and function of SCYB14 and screening candidate drugs for treating disorders involving inflammatory responses.

Claim 17; Page 14; 73pp; English.

The present invention describes genetic variants of the human small inducible cytokine subfamily B (Cyg-X-Cyg), Member 14 (BRAK) (SCYB14) canducible cytokine subfamily B (Cyg-X-Cyg), Member 14 (BRAK) (SCYB14) canducible cytokine subfamily B (Cyg-X-Cyg), Member 14 (BRAK) (SCYB14) corresponded to SCYB14 in studying the effect of SCYB14, in expressing SCXB14 protein for use in screening for candidate drugs to creat diseases related to SCYB14 activity, in studying the effect of the creation on the biological activity of SCYB14, and the binding affinity of candidate drugs targeting SCYB14 for the treatment of disorders involving inflammatory responses. Haplotyping methods from the present involving inflammatory responses. Haplotyping methods from the present contenting a specific condition or disease predicted to be associated with SCYB14 activity, or in the design of clinical trials of candidate drugs correcting a specific condition or disease sessificated with SCYB14 activity, Transgentc animals are useful for studying expression of the corrected against SCYB14 protein, and for testing the efficacy of therapeutic agents and compounds for disorders related to platelet against SCYB14 protein, and for testing the efficacy of therapeutic agents and compounds for disorders related to platelet agagregation in a biological system. The present sequence represents a preferred oligonucleotide detection primer for the human SCYB14 gene

Detecting colorectal cancer in a subject, involves detecting macrophage inhibitory cytokine or renal dipeptidase or their mRNA in feces or blood

Disclosure; Page 26; 59pp; English.

The invention relates to detecting CC (colorectal cancer e.g. colorectal adecoma), comprising: (a) detecting macrophage inhibitory cytokine (MIC) or renal dispeliase (RDP) in faceses or blood of a subject and comparing amount of MIC or RDP detected to that in normal subjects, where an elevated amount of MIC or RDP detected to that in normal subject; (b) isolating mRNA sample from facese of a subject, detecting MIC or RDP mRNA in the mRNA sample and comparing amount of MIC or RDP mRNA in the subject is an indicator of CC in subject; (c) r RDP mRNA in the subject is an indicator of CC in subject, (d) corresponded amount of MIC or RDP mRNA in the mRNA sample to amounts of MIC or RDP mRNA in the mRNA sample to amount of MIC or RDP mRNA in the subject is an indicator of CC in subject, with sample to amount of MIC or RDP mRNA in the subject of a subject, isolating an mRNA cample to amount of MIC or RDP mRNA in the subject; (d) contacting blood or faces of a subject, with the mRNA sample to amount of MIC or RDP mRNA in the subject, detecting activity of RDP in the blood or faces by detection of increased reacting activity of RDP in the blood or faces by detection of increased reacting activity of RDP in the blood or faces by detection of increased reacting activity of RDP in the blood or faces by detection of increased reacting activity of RDP in the blood or faces by detecting activity of RDP in blood or faces by to that in normal subject where an elevated amount of activity of RDP in the blood or faces of the subject is an indicator of CC in the binds to RDP or an inhibitor of RDP where the antibody or inhibitor is comparing the moiety which is detectable from outside of the subject and area of localisation of the moiety within the subject but outside the comparing in the faces or blood RDP reaction product or RDP substrate consulting in the faces or blood PDP reaction product or RDP substrate or an undertained reacting olderived from a man are assigned with the detectable moiety, where increased product or decrease

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequence of an oligomer generated to contain a 2'-O-alkylamino-modified nucleoside. The modified oligomer is an example of a compound (see AAQ85799-Q8833) for other examples) e.g. a nucleoside or oligomucleoside, which contains a ribofuranosyl sugar portion and a base portion, such that at least one of the nucleoside contains at a 2'-O-, 3'-O- or 5'-O-position, a substitution (see AAQ85799 for details of the substitutions). The compounds are useful in diagnostics, therapeutics and as research reagents particularly in antisense therapy for killing cells and viruses such as HTV, herpes or papilloma viruses. gene Identifying genes involved in skin stress and aging, useful e.g. in screening for cosmetic or therapeutic agents, based on differential expression

Claim 8; Page 69; 325pp; German.

The invention relates to identifying (M1) genes in vitro that, in humans or animals, are important for skin ageing and/or skin stress by serial analysis of gene expression between mixtures of transcribed and optionally translated, genetically encoded factors (A) obtained from young and aged skin, to identify that genes that show strong differential expression. (A) comprises protein or mRNAs or their fragments. (M1) is usefful for: identifying markers of skin ageing and/or stress; determining skin ageing and/or stress; and identifying or determining the effects of pharmaceutical or cosmetic agents for control of skin ageing. The present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to identifying (M1) genes in vitro that, in humans or animals, are important for skin ageing and/or skin stress by serial analysis of gene expression between mixtures of transcribed and optionally translated, genetically encoded factors (A) obtained from young and aged skin, to identify that genes that show strong differential useful for: identifying markers of skin ageing and/or stress; determining skin ageing and/or stress; and identifying or determining the effects of pharmacoutical or cosmetic agents for control of skin ageing. The present sequence is one of a group of human skin ageing/stress related expressed sequence tags (ABQ86246-ABQ87680) of the invention

The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis, to determine skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sumburn; psoriasis; scleroderma; ichthyosis; atopic dermatitis; sumburn; psoriasis; scleroderma; rosaccea; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the
                                                                                                                                                                                                                                  In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against e.g. skin cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; skin; dermatological; vulnerary; antipsoriatic; antiseborrhaeic; immunosuppressive; antiinflammatory; cytostatic; SAGE; neurodermatitis; psoriasis; dermatitis; skin cancer; EST; expressed sequence tag; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to identifying (M1) genes in vitro that, in humans or animals, are important for skin ageing and/or skin stress by serial analysis of gene expression between mixtures of transcribed and optionally translated, genetically encoded factors (A) obtained from young and aged skin, to identify that genes that show strong differential useful for: identifying markers of skin ageing and/or stress; determining skin ageing and/or stress; determining skin ageing and/or stress; and identifying or determining the effects of pharmaceutical or comentic agents for control of skin ageing. The present sequence is one of a group of human skin ageing/stress related expressed sequence tags (ABQ86246-ABQ87680) of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Identifying genes involved in skin stress and aging, useful e.g. in screening for cosmetic or therapeutic agents, based on differential gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human, skin, dermatological, vulnerary, antipsoriatic, antiseborrhaeic,

The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression ($AGE) so as to identify skin-expressed genes and quantify their expression ($AGE) (M1) is useful for identifying genes involved in skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma; inchthyosis, atopbic dermatitis, acne, seborrhea; lupus erythematosus; rosacea; melanoma; basal cell carcinoma, and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis; to becermine skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis; to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for tracting skin disorders, specifically neurodermatitis; sunburn; psoriasis; soleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea, melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (EST) of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against

The invention relates to in vitro identification (W1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis; to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea; melanoma; basel cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (EST) of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against e.g. skin cancer.

The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis to determine skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis, sumburn; psoriasis; scleroderma; inchthyosis; atopic dermatitis, acne, seborrhea; lupus ertythematosus; rosaces; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag
                                                                                                                                                                                                                                                                                                                     In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human, skin, dermatological, vulnerary, antipsoriatic, antiseborrhaeic,

The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression.

(M1) is useful for identifying genes involved in skin homeostasis; to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn, psoriaas; scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea, melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (EST) of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                       The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analygis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression.

(M1) is useful for identifying genes involved in skin homeostasis; to determine skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriaals; scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; ichthyosis; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag
                                                                                                                                                                                 In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against

The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis; to determine skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosace; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; skin; dermatological; vulnerary; antipsoriatic; antiseborrhaeic; immunosuppressive; antiinflammatory; cytostatic; SAGE; neurodermatitis; psoriasis; dermatitis; skin cancer; EST; expressed sequence tag; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis; to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis and to test agent (A) that maintains or ichthyosis; atopic dermatitis; sunburn; psoriasis; scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis; to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn, psoriasis, scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea, melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (EST) of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                             In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; skin; dermatological; vulnerary; antipsoriatic; antiseborrhaeic; immunosuppressive; antiinflammatory; cytostatic; SAGB; neurodermatitis; psoriasis; dermatitis; skin cancer; EST; expressed sequence tag; ss.

                                                                                                                             The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded fæters from skin, to serial analytsis of gene expression. (SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis, to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (EST) of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to in vitro identification (MI) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression. (MI) is useful for identifying genes involved in skin homeostasis; to
                            In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against

determine skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea; melanoma; basal cell carcinoma, and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The inventors claim a compen. which comprises a synthetic nucleic acid contg, an immobile or semi-mobile nucleic acid branched junction. More specifically, the compen. may also comprise a branch junction from which at least 3 duble helices emanate (Rank 3), esp. 3-8. Networks of the junctions may form 2- or 3-dimensional structures. When 4 double helices emanate (Rank 4), the compen. pref. comprises 4 hexadecanucleotides or 4 dodecanucleotides. The compsns. are stable structures useful as vertices of n-connected networks of nucleic acids. (Updated on 03-OCT-2002 to add missing OS field.) (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New synthetic nucleic acid(s) - contain immobile or semi-mobile nucleic acid branched junction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                    quence of one of four (no.3) dodecanucleotides which comprise a 'Rank branched junction blunt-ended nucleic acid compsn.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                a
"paired with bps 12-7 of hexadecanucleotide no.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /note = "paired with bps 6-1 of hexadecanucleotide no.

The invention provides a device, system and method for a programmable finite automaton comprising a biomolecule, such as DNA, and associated biomolecule-manipulating enzymes, that solves computational problems autonomously. The hardware for the automaton preferably includes biomolecule-manipulating enzymes, such as restriction nucleases and ligamese, the software for the automaton preferably includes biomolecule-manipulating enzymes, such as restriction nucleases and ligamese, the software and input are preferably encoded by double-stranded DNA, and programming is preferably perferand by choosing appropriate software DNA molecules. The molecular computing machine uses the free-energy difference between its input and output to accomplish a computation, preferably using its input DNA molecule as a partial or the sole source of energy. It transforms an input DNA molecule into an output DNA molecule by digesting the input as it computes. An exemplary molecule inclease FoxI, 74 DNA ligase and ATP. The software comprised 8 short nuclease FoXI, 74 DNA ligase and ATP. The software comprised 8 short sequence, encoded the initial state of the automaton and the present sequence, encoded the initial state of the automaton and the input. The computation started when the hardware, software and input are mixed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Programmable finite biomolecular automaton for performing computation through manipulation of molecules, includes polymeric biomolecule, and biomolecule-manipulating components.

This invention describes a novel method for sequencing an unknown DNA molecule which comprises selecting a library primer from an octamer of digonaclectide library consisting of 48 beb sequences and corresponding complementary sequences, where the library primer is complementary to a known sequence adjacent to the unknown sequence or is complementary to a sequence in a known extension product. The method is useful for DNA nucleotide sequencing, in PCR, and in other processes which make use of primers. The octamers are used to identify coding sequences. Primer walking using the octamer libraries is advantageous over other sequencing methods because it does not require multiple cloning steps nor subsequent template preparations, and it is a directed and methodical approach.

AAA&0688-A8125; represent the octamer primers used in the primer walking
                                                                                                                                                                                                                                                                                                                                                                                                 Sequencing an unknown DNA molecule for the polymerase chain reaction and other primer processes comprises primer walking of octamer oligonucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; immune gene repertoire; T-cell receptor; TCR; immune disorder;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human immune gene variable region amplifying TCRB 3' PCR primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               .

Two primers are used to amplify any given mRNA molecule in its cDNA form. The first primer is capable of binding either to (1) a site immediately upstream of the first adenine nucleotide of the poly A tail; (2) to a site including the mRNA's poly A signal sequence; (3) to a site including the mRNA's poly A signal sequence of an mRNA of which the nucleotide sequence or (4) to a sequence of an mRNA of which the nucleotide sequence the ornesponding cDNA sequence. The second primer comprises an arbitrary sequence and is used alongside the first primer to amplify the cDNA molecule by PCR. This primer is a second arbitrary primer. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AIP-1; allograft inflammatory factor 1; transplant rejection; inhibitor; immunogenic; detection; diagnosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAQ99334-Q93396 are primers used to identify DNA from both allogeneic a syngeneic sources to determine where a specific gene is expressed. The AIF-1 gene is a differentially expressed allograft gene which is expressed in allograft tissue during transplant rejection. Identificati of the AIF-1 product (AAR80520) or transcript indicates that allograft
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DNA encoding allograft rejection factors and immunogenic fragments useful for identifying transplant rejection inhibitors.
                                                                                                                                 Cloning and isolating mRNA as cDNA - by reverse transcription and polymerase amplification using two oligo-deoxy-nucleotide(\theta).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Syngeneic and allogeneic transplant comparison primer, OPA-16.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a method for profiling immune gene repertoire or detecting the presence of a specific immune gene in a vertebrate. The method comprises hybridising the nucleic acid molecules representing the immune gene repertoire, to immobilised objectules. The method is useful for profiling the antibody and T-cell receptor (TCR) mRNA repertoire of an organism, and for detecting the presence of a specific immune gene in a vertebrate. Compounds that increase or reduce the transcription of at least one immune gene, the number of immune receptors and/or the number of immune cells in a vertebrate, are useful for treating an immune disorder. The present sequence is human immune gene variable region amplifying PCR primer consensus sequence. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                               Characterizing immune gene repertoire or detecting the presence of a specific immune gene in a vertebrate, comprises hybridizing the nucleic acid molecules representing the immune gene repertoire, to immobilized oligonucleotides.
